

The course "Introduction to Innovation and Entrepreneurship" has given me plentiful information and abundant knowledge on being an entrepreneur, such as how we students can use different resources and concepts, such as the empathy map and lean canvas, to create and implement our own ideas if we start a business. In addition, we have learned about some cutting-edge technologies, such as blockchain and artificial intelligence, and how they affect the current landscape of innovation and entrepreneurship in Hong Kong and the world.

The forum participation and class discussion gave me a more in-depth perspective on these concepts, such as the advantages and disadvantages of using these technologies and the real-life implications of utilising these technologies in society, with the benefits and harm they may bring to us.

One example that was deeply impressionable to me was the application of Artificial intelligence in entrepreneurship. In my self-learning, I learned more about this concept, and I became more aware of potential developments in the field, especially around generative AI. This course made me understand that innovation is constant and recognising how it develops is critical for self improvement.

My programme of study is in Computing and AI. By learning about innovation and entrepreneurship, I gained valuable knowledge of how I can apply these concepts that I have learnt in my programme in my future work, whether or not I start a business or not. In addition, learning about the applications of AI and IoT in the technology sector facilitated my interest in companies using these new technologies for their services. Furthermore, this can make me more competitive in internships and work.

While I would like to pursue a master's degree or even a doctorate in the future, learning about how new technologies are exploited can allow me to keep up with the times, which is very important for my studies. Related to this, learning about these concepts now has built up a foundation for me to develop more knowledge and interest in this field, allowing me to be at the forefront of innovation in the future, which is my dream.

Moving on to my strengths and weaknesses, my greatest strengths are my observational ability and my ability to work as a team. Having excellent observational abilities equip me to be able to see problems and predict when they are going to happen in work. This will be largely useful both in academia and research. Being well experienced in working in a team and mediating between parties in a team, I can work in a team or in a workplace competently, which is beneficial as I can prevent problems from happening in a group. Some other strengths that I have is my drive to learn new and interesting things. This allows me to have a huge knowledge base where I can access related concepts to assignments that I am working on, allowing me to apply what I have learned effectively into my work.

Conversely, my greatest weakness is my lack of initiative and my introverted nature. As such, knowing my strengths and weaknesses, I expect that I can recognise opportunities in the future. However, knowing my lack of initiative, I need to take advantage of the opportunities that will come in the future to benefit myself. In addition to this, my lack of initiative will cause me to not prepare for the future, such as doing pre-learning and learning

about out of syllabus concepts, which may severely hamper my future, causing me to fail at overcoming challenges. To solve this problem, I believe that learning how to learn effectively by using concepts such as priming and the pomodoro technique can help me in my academic journey. In the winter or summer break, I would also learn about future subjects such as data structures and also coding languages such as SQL to benefit myself.

Analysing my introverted nature, it is also one of my major weaknesses. Interacting in social occasions causes me to be very lethargic, which discourages me from going to these gatherings and talking to strangers. However, these gatherings are extremely critical for networking and internships, which are central to getting opportunities for work and research. Overcoming this weakness is a herculean task and thus I had been chipping away at it ever since I have entered PolyU, by entering events held by my programme's society and also joining AIESEC. Through the gradual acclimation to these gatherings, I believe that my introverted nature will become less and less of a problem to my prospects
